MAKE BETTER DECISIONS CONFIDENTLY

NEWSLETTER

We recently attended the National Workers' Compensation & Disability Management Conference and presented on getting an MRI Read Right the First Time as part of the conference's virtual symposium in the fall. Clinical studies consistently show a 30% accuracy gap between a general radiologist and fellowship trained, sub-specialized radiologists. In the claims world, cost savings hangs in the balance of clinical quality and expeditious, accurate care. Authentic4D delivers on all accounts. [Watch the video below](#) to learn how the fusion of expert reads and technology leverages patient care and insurance provider benefit.

Fellowship trained, sub-specialized radiology reads don't just apply to Workers' Compensation Claims, though. Did you know that 46% of initial radiology reads in the casualty insurance space are disagreed with by fellowship trained, sub-specialized radiologists? This is often because of an over-call by an under-qualified radiologist. A major factor that results in over-calling by general radiologists on scans stems from assessment of the differences between acute and chronic injuries. A fellowship trained radiologist, however, can tell acute from chronic conditions more than 80% of the time! Learn more about fellowship trained, sub-specialized radiologists [here](#).
